Wishfire Idle-Stage Migration Atlas

A visual systems guide for moving from turn-based party combat to a G123-fl
Legend-style real-time idle RPG.

PLANNING ONLY EVIDENCE CHECKED 360 X 640 TARGET

THE PRODUCT SHIFT IN ONE SENTENCE

Move player decisions out of turn-by-turn attacks and into party builds, gear choices, automatic skill priorities, stage attempts, an long-horizon progression while combat runs continuously.

- Keep Wishfire identity: four-hero party, readable VFX, quest structure, gear, and browse
- Build the new authority: waves, bosses, cooldowns, lamps, idle rewards, and durable cla

REFERENCE LOOP

CURRENT FOUNDATION

PRODUCT SCOPE

What “clone” means here

Copy the proven system grammar. Preserve Wishfire’s setting, party identity, and readable combat presentation.

KEEP

- Four-hero party
- Browser-first 360 x 640 shell
- Quest and chapter identity
- Readable VFX and damage cadence
- Equipment slots, rarity, CP

REARRANGE

- Player agency moves to builds
- Combat becomes continuous
- Session card choices become presets
- Bosses gate stage progress
- Loot decisions sit on main screen

ADD

- Lamp reward loop
- Wave and boss authority
- Real-time actor cooldowns
- Offline reward ledger
- Dailies and one event layer

DEFER UNTIL THE CORE LOOP EARNS IT

Guilds, cross-server competition, ad rewards, paid gacha, battle passes, and multiple event currencies require identity, and economic controls.

OBSERVED REFERENCE

Why the reference screen works

The battle keeps moving while the player makes progression decisions around it. The screen is a loop controller, not a spectator window.

FIVE JOBS IN ONE SCREEN

01 Stage, resources, and boss gate

02 Continuous combat stays visible

03 Auto skills fire without prompts

04 Gear compare: equip or sell

05 Lamp remains the repeat action

LOOP PRINCIPLE

Motion

Combat never waits for a menu decision.

Decision

Loot asks one fast question: stronger or currency?

Progress

Stage and boss results unlock better rewards.

Return

Offline gains create a reason to reopen.

Breadth

Side systems deepen the same power goal.

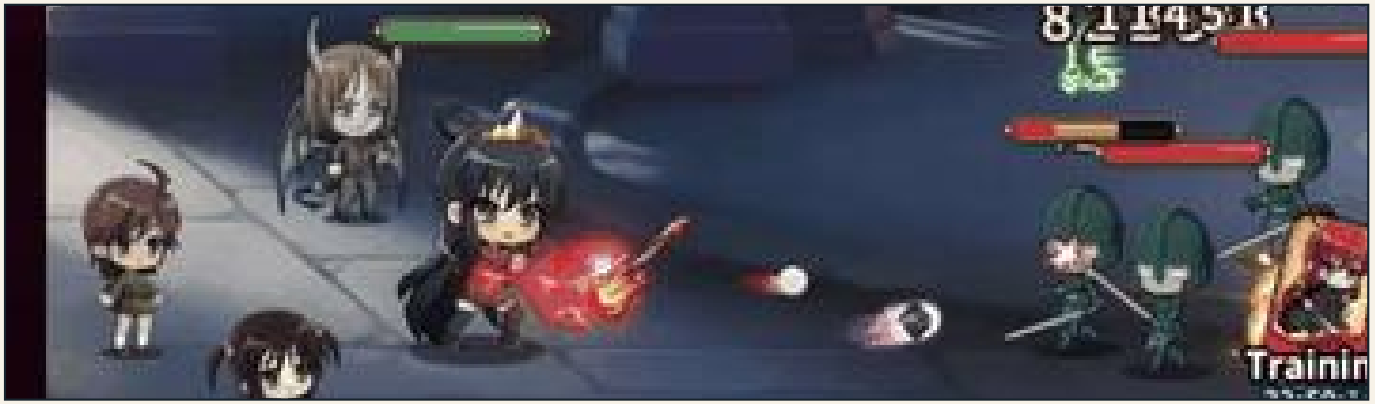

Source: Legend of Mushroom gameplay screenshot [S2/S4].

PLATFORM TARGET

Aim for the G123 delivery model

Instant browser access, compact party combat, fast returning sessions, and many systems routed through one stage screen.

WISHFIRE INTERPRETATION

01	**Instant entry**	Playable before account commitment; recovery and linking can follow.
02	**Compact party**	Keep four heroes visible, with automated skills and small formation offsets.
03	**Short return loop**	Claim, lamp, compare, upgrade, boss attempt, leave.
04	**Cross-device shape**	The current 360 x 640 logical viewport already fits the delivery goal.

Sources: G123 official promotion and platform materials [S5-S7]; user-provided combat reference.

CURRENT MERGED MAIN

Wishfire already has the outer shell

The new product should reuse the proven shell and data while replacing the turn authority at the center.

CURRENT MAP / HOME

CURRENT INTERRUPTIVE COMBAT

FOUNDATION AUDIT

REUSE	360 x 640 shell and nav
REUSE	4 heroes, kits, EXP
REUSE	6 gear slots, 5 rarities
REUSE	market, save, CP math
ADAPT	quest ladder into stages
ADAPT	VFX into cooldown cadence
REPLACE	explicit actor turn loop
REPLACE	session card interruptions
BUILD	lamp and offline ledger

The loop to build first

Every added system must feed power, stage progress, or return motivation. The first proof needs only this closed circuit.

The first closed product loop

Six steps reinforce stage progress around the player's build de

ARCHITECTURE

Real-time rules with readable presentation

Use one deterministic scheduler for combat truth and one presentation queue that prevents effects from piling up.

Combat authority and readable cadence

Simulation resolves truth through four owners; presentation exposes one timed package.

EXAMPLE: 1.2 SECOND HERO CADENCE

Rule: simulation may know the next event, but the visible package owns the stage until its minimum readability window completes. This preserves the combat clarity already prov

Upgrade path: animation event markers can replace fixed windows after the art pipeline matures.

Move decisions before and between fights

Automation removes attack-by-attack selection. It must create stronger build decisions in exchange.

Agency moves from turns to buildcraft

Five repeated combat choices become five durable preparation choices.

CURRENT TURN MODEL

1. Choose the acting hero
2. Choose attack / heal / card
3. Wait through a serialized action
4. Repeat each actor turn
5. Resolve session offer interruptions

TARGET IDLE-STAGE MODEL

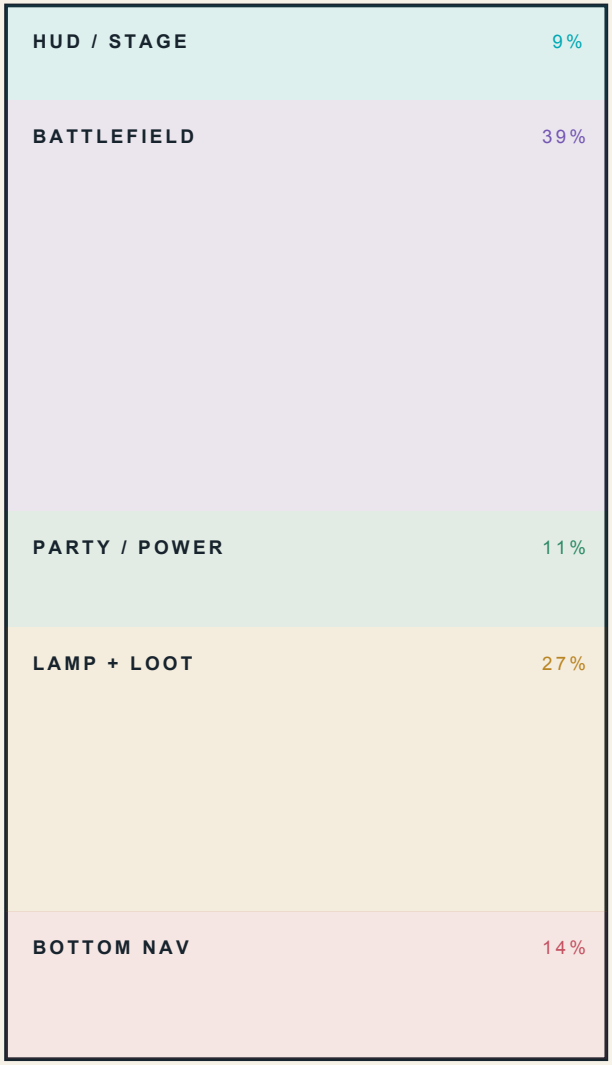

1. Set three active skills per hero
2. Set target and ultimate priorities
3. Equip, sell, and level gear
4. Choose companions and one relic
5. Trigger boss attempts and claims

AGENCY MOVES TO BUILDCRAFT

SIZE, NOT CHARACTER APPEARANCE

360 x 640 proportional layout

Keep battle readable on a phone while the lamp decision remains reachable. These are starting ratios, not final art direction.

PROPORTION STARTING POINTS

Hero height	**48-64 px**	20-26% of battlefield height
Enemy height	**42-58 px**	Boss: 72-96 px
Normal impact	**0.55-0.90 x actor height**	Large impact: up to 1.2 x
Touch target	**44 px minimum**	Primary lamp control: 68-84 px
Gear compare	**1 item at a time**	Two large actions: equip / sell
Visible currencies	**3 in top HUD**	Overflow opens the resource drawer

READABILITY RULE

At 360 px wide, simultaneous actors are silhouettes and state carriers. Detail belongs in hero, equipment, and

SCOPE MAP

Reuse, adapt, build, defer

This is the migration boundary. It prevents a rewrite of working foundations and blocks premature live-service scope.

REUSE	ADAPT	BUILD	DEFER
Responsive shell	Quest ladder	Stage authority	Guilds
Hero definitions	Hero commands	Cooldown scheduler	Cross-server
EXP progression	Action presentation	Lamp inventory	Ads / paid gacha
Equipment model	Market UI	Offline ledger	Battle pass
Save storage	VFX placement	Daily reset	Multi-event calendar
Combat power	Map / chapter UI	Auto skill presets	PvP seasons
Browser tests	Gallery shells	Reward audit trail	Backend social

'Gallery shells' means navigation/presentation exists; gameplay depth still must be implemented when promoted.

SYSTEM STACK

Build depth in layers, not all at once

A strong idle RPG compounds a few clear growth systems. Each layer earns a visible outcome in combat.

Progression arrives in layers

Each layer earns a combat outcome before the next layer enters scope.

POWER FUNNEL Every layer improves stage clear speed, boss survival, or reward access. A layer with no clear effect belongs outside the first migration.

MINIMUM VIABLE WALLET

Start with five currencies

The reference genre can drown players in tokens. The alpha wallet should remain legible and auditable.

G	**GOLD**	Gear upgrades and broad sinks	SOURCE: STAGE / SELL
L	**LAMPS**	Roll one equipment item	SOURCE: STAGE / BOSS
S	**SKILL TOKENS**	Upgrade automatic skills	SOURCE: DUNGEON / DAILY
C	**COMPANION TOKENS**	Acquire and grow companions	SOURCE: DUNGEON / EVENT
D	**DUNGEON KEYS**	Limit special reward runs	SOURCE: DAILY RESET

LATER, WITH SERVER AUTHORITY

Premium currency, paid lamps, ad claims, passes, compensation mail, and event exchanges.

Add only after telemetry and fraud controls exist.

ANTI-INFLATION RULE

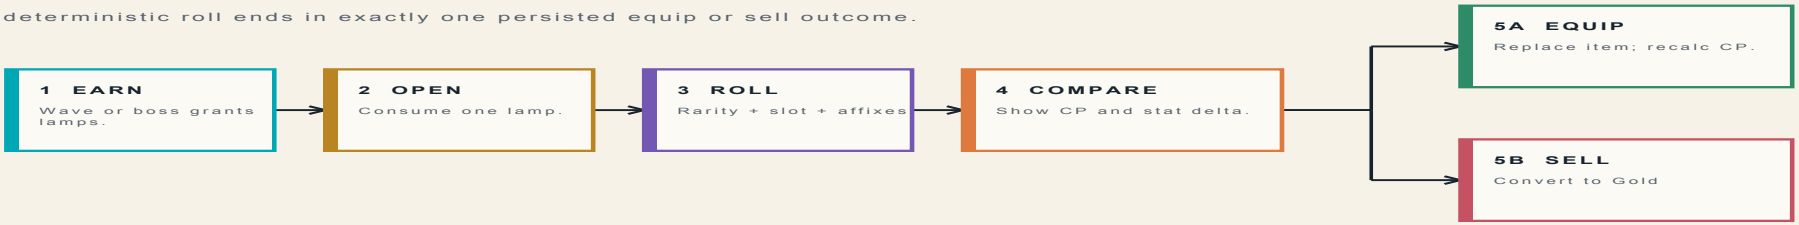

Every source needs a sink, a daily ceiling, and a single owner. Reward tables should identify source, amount, cap, and claim key.

Turn the existing equipment model into the main reward loop

Wishfire already owns six slots, five rarities, equipment stats, purchases, persistence, and combat-power math.

One lamp becomes one durable gear decision

A deterministic roll ends in exactly one persisted equip or sell outcome.

ROLL CONTRACT

INPUT	lampId, stageId, lampLevel, rollSeed
OUTPUT	equipmentId, rarity, slot, stats, sellValue
DECISION	equip / sell / hold one pending item
PERSISTENCE	atomic consume + result + decision
AUTOMATION	rarity floor, CP floor, slot filters
PROTECTION	idempotent claim and deterministic replay

Reference: lamp rarity odds and gear loop [S2-S4, S9].

WISHFIRE-SPECIFIC ADVANTAGE

Keep the party; automate the kit

The target differs from a one-avatar clone: four heroes remain the strategic object.

F FARA
TANK

taunt > guard > strike

H HONDO
FIGHTER

lowest HP > front enemy

R RUNA
CONTROL

cluster > debuff > burst

K KAJA
SUPPORT

heal threshold > buff > attack

FIRST AUTO-BUILD SURFACE

3 ACTIVE SKILLS

Current action slots become cooldown-equipped skills.

1 ULTIMATE

FLOW becomes an automatic ultimate with a condition.

2 COMPANIONS

One passive aura and one triggered helper.

4 PRIORITIES

Target, heal threshold, ultimate condition, boss mode.

NO MID-FIGHT MENU REQUIRED

Offline rewards must behave like a bank ledger

The client may display elapsed time. Reward truth needs deterministic, idempotent settlement.

DAILY RHYTHM

- Claim capped idle chest
- Spend lamps and compare gear
- Run one skill or companion dungeon
- Attempt the current boss
- Collect one daily milestone

SERVER BOUNDARY

- Authoritative time and claim keys
- Inventory mutation and purchase receipts
- Daily reset and event windows
- Mailbox / compensation
- Guild, ranking, PvP, cross-server

Prototype may run locally; production settlement should move to server authority before monetized rewards.

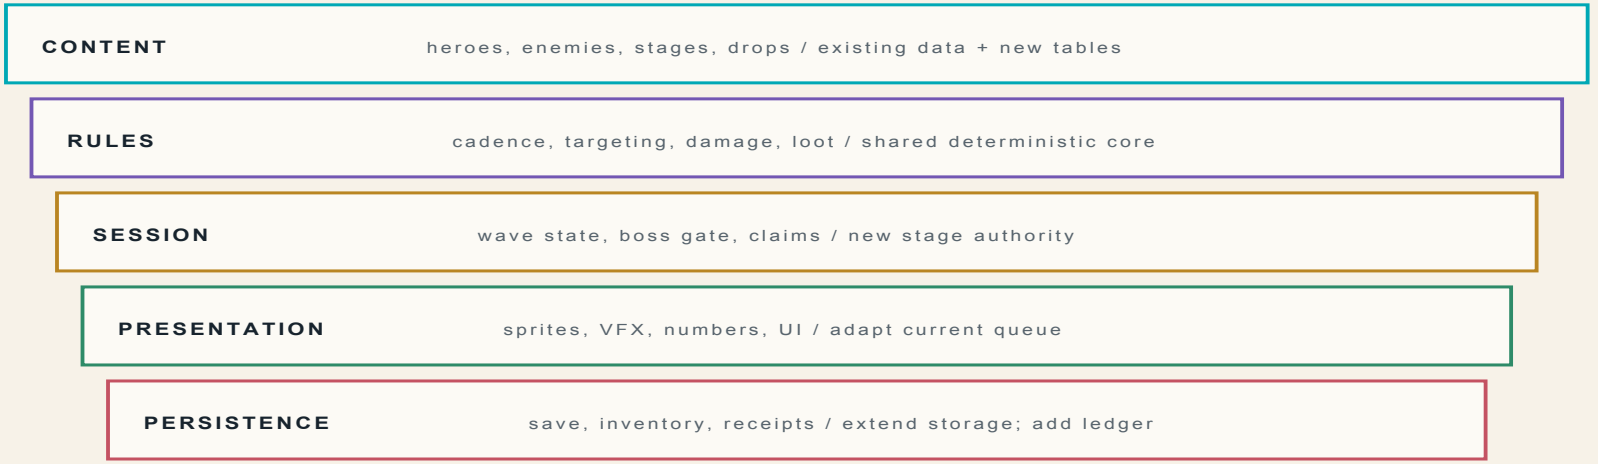

MODULE MAP

Put each rule in one home

Keep the browser shell thin. Deterministic rules remain testable without the rendered game.

One owner for each rule

Deterministic content and rules feed stage authority; presentation may lag without changing truth.

OWNERSHIP TEST Given the same seed and commands, RULES + SESSION must reproduce the same result without DOM, timers, or images. PRESENTATION may lag, truth.

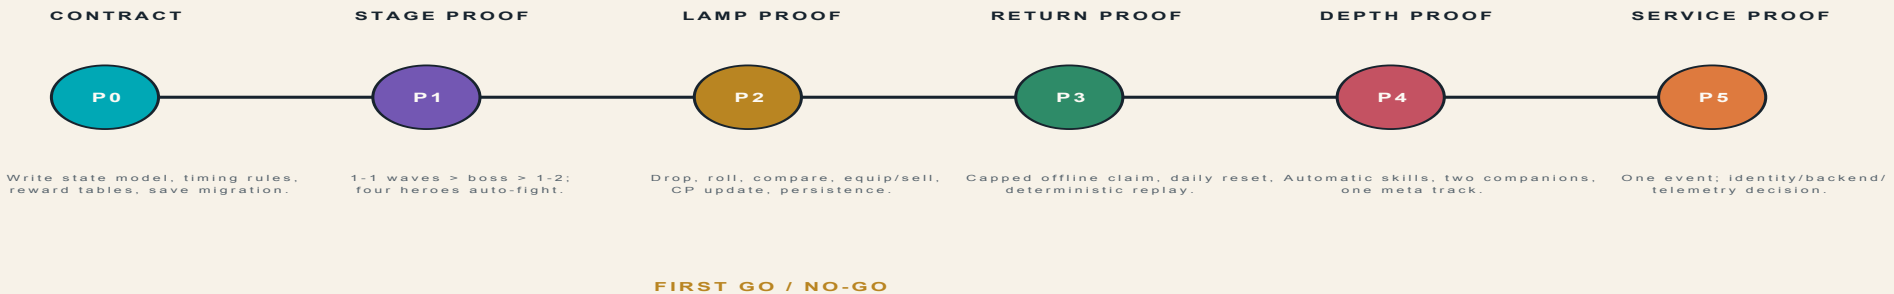

IMPLEMENTATION ORDER

Six gated phases

Each phase ends with a playable proof. Stop when evidence fails; breadth does not rescue a broken core loop.

Six proofs gate the migration

Each phase ends with a playable proof; P2 is the first go / no-go milestone.

P2 IS THE FIRST GO / NO-GO MILESTONE

1. A party clears a full stage without player attack input.
2. At least one enemy drops a lamp.
3. Opening it produces one auditable gear roll.
4. Equip or sell changes persistent state and combat power.
5. Reload restores the exact stage, party, and inventory.

QA PLAN

How we know the migration works

Runtime proof should show human-readable combat, deterministic rules, durable claims, and stable phone-scale layout.

LOOP	Watch 1-1 > boss > 1-2 without intervention.	VIDEO + STATE LOG
CADENCE	No VFX, damage number, death, or spawn overlaps incorrectly.	TIMELINE ASSERTIONS
LOOT	Same seed yields same lamp item; equip/sell commits once.	REPLAY TEST
OFFLINE	Clock changes cannot duplicate a claim; cap is visible.	LEDGER TEST
SAVE	Reload and second tab preserve one inventory truth.	PERSISTENCE TEST
SCALE	360 x 640 and compact 216 x 384 remain readable.	SCREENSHOTS

RELEASE BLOCKER Any duplicate reward, resurrected target, interrupted visual package, or invisible stage transition blocks the milestone.

HANDOFF

Evidence and open decisions

Primary sources establish the product grammar; secondary guides fill version-sensitive loop details. Recommendations remain Wishfire-specific.

DECISIONS BEFORE P0

1. **Battle speed target**
   Choose 1x cadence and maximum simultaneous packages.
2. **Stage structure**
   Define waves per stage and boss-failure behavior.
3. **Lamp cadence**
   Set drop rate, storage cap, and rarity curve.
4. **Gear comparison**
   Choose CP weighting and stat exception rules.
5. **Offline cap**
   Choose eligible hours and stage-based reward rate.
6. **First meta layer**
   Pick companions, mount, or relic; ship one.
7. **Backend point**
   Decide when local proof hands off to server authority.

RECOMMENDED START

Approve P0 only: write the state contract, timing budget, reward tables and save migration before changing runtime code.
